Events Made Simple and Smart

LITERATURE SURVEY

- Existing event management systems mainly focus on event registration and attendee management.
- Many systems provide event schedules, venue details, and session information.
- Online platforms reduce manual work by providing digital registration and event information.
- Database-based systems help manage attendees, events, sessions, and registrations efficiently.
- Some systems support notifications and attendee communication.
- However, attendee services such as transactions, seat allocation, and complaint handling are often handled separately.
- These observations helped us design EventEase as an integrated attendee self-service system.

RESEARCH GAP

- Existing systems mainly focus on event registration and information management.
- Attendees may still depend on organizers for support and event-related queries.
- Transaction processing and seat allocation are not always integrated into the attendee workflow.
- Complaint handling and escalation may be managed separately.
- There is a need for a centralized self-service platform combining these functions.
- EventEase addresses this gap by integrating registration, transactions, seat allocation, notifications, and complaint management.

PROPOSED METHODOLOGY

- Requirement Analysis – Identify attendee and organizer requirements.
- Database Design – Define entities, relationships, keys, and constraints.
- Normalization – Reduce data redundancy and maintain consistency.
- Backend Development – Develop REST APIs for application and database operations.
- Frontend Development – Build the EventEase web interface for attendee self-service.
- Testing & Integration – Test queries, APIs, registration, transactions, and seat allocation.
- Final Integration – Connect Frontend → REST API → MySQL Database.
