

EVENTEASE

Event Management Mobile App for Attendee Self Service

2520090212- J Rakshitha
2520090214- N Charishma
2520090067- Sahasra

Events Made Simple and Smart

PROPOSED METHODOLOGY

- Requirement Analysis – Identify attendee and organizer requirements.
- Database Design – Define entities, relationships, keys, and constraints.
- Normalization – Reduce data redundancy and maintain consistency.
- Backend Development – Develop REST APIs for application and database operations.
- Frontend Development – Build the EventEase web interface for attendee self-service.
- Testing & Integration – Test queries, APIs, registration, transactions, and seat allocation.
- Final Integration – Connect Frontend → REST API → MySQL Database.

SYSTEM ARCHITECTURE

TECHNOLOGIES USED

- Frontend: HTML, CSS, JavaScript
- Backend: Node.js, Express.js
- API: REST API
- Database: MySQL
- Development Tool: Visual Studio Code
- Database Concepts: SQL, Joins, Normalization, Transactions
- Data Format: JSON for frontend–backend communication

DATASET

- The dataset is designed for an event management and attendee self-service system.
- It contains information related to attendees, events, registrations, sessions, speakers, and venues.
- It also includes seat allocation and transaction details for managing event participation.
- Attendance, notifications, and complaints are included to support attendee services.
- The dataset contains 2,500 attendees and 200 events with multiple registrations and sessions.
- Registration and transaction data are used to demonstrate database transactions and seat allocation.
- The dataset is used as the input for database design, SQL operations, API development, and system testing.
-
